

INFORMED CONSENT FOR UVB THERAPY

BioPhotonic Therapy—UV Blood Irradiation

UVB Therapy is a treatment in which a small amount of blood is drawn from the patient, combined with heparin and saline, exposed to UV light and allowed to flow back into the patient's body. UVB therapy is used clinically for specific conditions including but not limited to chronic fatigue, auto-immune, certain forms of cancer, infections and tissue transplant rejection conditions.

UVB Therapy can do the following:

- Cause beneficial changes in the blood, including clotting changes, metabolic changes, changes in blood flow and oxygen use, and stimulation of the production of red blood cells.
- Improve immune defenses and regulation of immune system.
- Dismantle bacteria, fungi and viruses in the bloodstream.

Risks of UVB Therapy include Phlebitis, infection at the site of the treatment, blood clots, and minimal to no improvement after the therapy.

Benefits of UVB Therapy include the possibility for successful treatment of a number of different conditions, including bacterial, fungal and viral infections and auto-immune diseases.

UVB Therapy cannot be billed to insurance. All treatments are paid for at time of service.

I, _____, am choosing to have UVB Therapy for my condition and I fully understand the risk, benefits, and potential side-effects as disclosed above.
